Automation of the process of making and documenting design drawings is one of the most important factors in the effective design and production of products and buildings. Currently, the most commonly used method for design documentation is the process of printing a hard copy drawing from the design software using a hard copy printer. A typical CAD process consists of the following main steps. \* Design is done using a computer-aided design software (CAD) application. \* Design is rendered to a file called a dxf file, which is an extension of the dgn file format. \* This dxf file is then sent to a dxf raster image processor (RIP) application. \* The dxf file is converted to a raster image format called a spf file. \* This spf file is sent to a laser color printer. However, there are some problems with this process. In most software, a large file size is required for the dxf file due to the resolution of the scanned image and the grayscale or color used to render the image. Most CAD software is not designed to handle directly large numbers of drawings. There are no automatic methods to rasterize large numbers of drawings and process them as a batch. The input spf file is not a direct output of the original CAD application. There is no direct method for converting a spf file to any other form. It is usually a collection of raster images. A laser color printer is not suitable for large format printing, where the size of the paper or media used to render the drawing is large. For example, a typical printed sheet is about 29.7 x 20.3 cm, while a typical paper size used to render a drawing file is an A3 sized sheet that is about 297 x 420 mm. A CAD application usually cannot produce a dxf file for the rendering of a drawing directly. There is no direct method to pass the output of a rendering engine directly to a dxf file. Usually, the data has to be first passed to a spf file. A file size of a spf file can be as large as 16MB per drawing. The spf file format is proprietary, which limits the wide use of the format. There is no common way to represent a set of dxf files and a set of spf files. The above are the main issues in the current CAD design and printing process. In AutoCAD 2007

The program's job market is composed of both public sector and private sector jobs. Around 70,000 people work as AutoCAD users in the United States, and around 40,000 of these people are employed by the public sector, with many more by the private sector. AutoCAD is used for design, manufacturing, and construction throughout the world. AutoCAD is the most commonly used software tool in architectural, engineering, and construction. AutoCAD has a large following in the United States. In 2007, for example, AutoCAD was used in more than 50% of commercial buildings in the United States. The United States Census Bureau estimated the total number of AutoCAD users in the United States in 2008 at more than 1.1 million. In 2017, the construction division of Autodesk announced that AutoCAD would be replaced by Revit in 2019. Revit is a computer-aided design (CAD) product from Autodesk. Revit was previously included in AutoCAD LT, Autodesk's non-commercial package of basic CAD tools. History AutoCAD started as Auto Layout. 1990s The first version of AutoCAD was released in 1991, and was based on 1990s computer architecture. The program provided about 80 MB of memory for up to 250 drafting objects, plus a drawing window (window space). AutoCAD 2 was released in 1993, with a number of significant changes: a new operating system, Windows NT, was introduced; a drawing space was introduced; and a number of new features were included, including section planes, grids, and many drafting commands. New layout commands were also included. AutoCAD 2.5, released in 1994, made AutoCAD run more smoothly and included a number of new features, such as Xrefs. AutoCAD 2.5 allowed up to 250 objects to be drawn, plus a window. AutoCAD 3.0 was released in 1997. It introduced many important changes: the drawing size was increased to 256 MB, and the number of objects that could be used for a single drawing was increased to 500. It also

included a number of new drafting commands and the ability to undo actions. AutoCAD 3.5 was released in 1998. It included many of the features of AutoCAD 3.0 and 3.5, and also included the ability to create drawing tables. AutoCAD 4.0 was released in 1999 a1d647c40b
