The virtualization technology can be applied to both desktop computers as well as server computers. It enables the sharing of resources by a number of users, which can be located anywhere that has adequate connectivity to the network. Server virtualization is a technology used by computer users to make the workloads and resources of the computer systems available to multiple users with similar or different needs without the need to shut down the system, restart it or install software and/or hardware configuration changes to the physical machine. Enterprise virtualization is generally implemented on or in conjunction with other supporting technology including storage area networks (SANs), network attached storage (NAS) and/or fiber channel products. This allows the users of a specific computer to run a desired operating system on a server, without using the hardware of the server itself. When an administrator or a system developer needs access to a program that is not already installed on a server they may choose to install that program on a server. Even though all of the components are separate physical machines, they will share resources as if they were one and the same computer. When a program is no longer needed, the administrator will need to remove it from the server in order to reclaim resources for use in other ways. Server virtualization is an increasingly common way of providing computers in an organization to multiple users. The x86 based server virtualization standards such as

Microsoft's Virtual Server and VMware's vSphere are examples of server virtualization. Winpoker.win It provides additional administrators the option of working remotely with their systems from any of the network. This enables the administrators of the system to monitor and maintain them over a network. It is also possible for the administrators to set up a system to send alerts or receive notifications.
